

I. AMENDMENTS TO THE CLAIMS

This listing of the claims will replace all prior versions and listings:

Listing of Claims:

Claims 1-11 (Canceled)

Claim 12 (previously presented) An organic electroluminescent display, comprising:

- a plurality of parallel first display electrodes, located on a substantially transparent substrate;
- an opaque insulating layer, formed over the substrate and partially exposing the first display electrodes, wherein the opaque insulating layer includes a plurality of slots;
- a plurality of insulating ramparts, located on the display electrodes and protruding from the slots of the opaque insulating layer ;
- an organic electroluminescent material, disposed on exposed regions of the first display electrodes; and
- a plurality of second display electrodes, located on the organic electroluminescent material, the second display electrodes being perpendicular to the first display electrodes.

Claim 13 (previously presented) The organic electroluminescent display according to claim 12, wherein the insulating ramparts extend in overhang portions having a tapered section, a side of the tapered section forming an angle of about 40-80 degrees with the substrate.

Claim 14 (previously presented) The organic electroluminescent display according to claim 12, wherein the thickness of the insulating ramparts is in a range of about 1-5mm.

Claim 15 (previously presented) The organic electroluminescent display according to claim 12, wherein cross-linking is in a greater amount in a portion of the insulating ramparts in proximity to the substrate than in a portion of the insulating ramparts further away from the substrate.

Claim 16 (previously presented) The organic electroluminescent display according to claim 12, wherein the opaque insulating layer is made of polyimide incorporated with dark pigments.

Claim 17 (previously presented) The organic electroluminescent display according to claim 12, wherein the opaque insulating layer has a thickness of about 1-2mm.

Claim 18 (previously presented) The organic electroluminescent display according to claim 12, wherein the slots of the opaque insulating layer has a width of about 5-30mm.

Claim 19 (previously presented) The organic electroluminescent display according to claim 12, wherein the insulating ramparts are made of a photoresist material.

Claim 20 (previously presented) An organic electroluminescent display, comprising:

- a first display electrode on a substantially transparent substrate;
- a pattern of opaque insulating layer, disposed on the first display electrode;
- a pattern of insulating ramparts, placed on the first display electrode, wherein the insulating ramparts have overhang portions overlapping the pattern of opaque insulating layer;
- an organic electroluminescent material, located on the first display electrode between the insulating ramparts; and
- a second display electrode, located on the organic electroluminescent material.

Claim 21 (previously presented) The organic electroluminescent display according to claim 20, wherein the insulating ramparts extend into overhang portions having a tapered section, a side of the tapered section forming an angle of about 40-80 degrees with the substrate.

Claim 22 (previously presented) The organic electroluminescent display according to claim 20, wherein the thickness of the insulating ramparts is in a range of about 1-5mm.

Claim 23 (previously presented) The organic electroluminescent display according to claim 20, wherein cross-linking is in a greater amount in a portion of the insulating ramparts in proximity to the substrate than in a portion of the insulating ramparts further away from the substrate.

Claim 24 (previously presented) The organic electroluminescent display according to claim 20, wherein the opaque insulating layer is made of polyimide incorporated with dark pigments.

Claim 25 (previously presented) The organic electroluminescent display according to claim 20,
wherein the opaque insulating layer has a thickness of about 1-2mm.

Claim 26 (previously presented) The organic electroluminescent display according to claim 20,
wherein the insulating ramparts are made of a photoresist material.
